Island Grown

HARDY

Lily Bulbs

Wholesale prices

C. L. SHRIDE

VASHON, WASH.

Vashon Island is in Puget Sound between Seattle and Tacoma.

Freight and express leave Vashon each week day morning.

Telegrams are delivered promptly via Seattle.

Refrigerator freight leaves Seattle Tuesday and Wednesday of each week.

I consider a Lily bulb mature when the seed is ripe. June flowering varieties are ready in September, Regale about the first of October, and Henryi two weeks later. If bulbs are wanted for immediate planting they may be dug earlier.

Bulbs are packed in peat or wrapped in fruit paper. I do not pack bulbs for storage.

Shipment is made in wooden boxes of convenient size, as light in weight as is considered safe. Uniform packing so you can sell without repacking if you wish. I also ship direct, using dealer's tags.

Sizes given are circumference unless otherwise stated.

10% may be deducted from these prices on orders for 5000 or more.

TERMS: 2% ten days, net 60 days, to firms with first class rating.

All orders received subject to crop.

L. CERNUUM

A dainty and rare little Lily, blooming just after *Tenuifolium* which it closely resembles. The flowers are purplish-pink, slightly spotted and have a spicy fragrance. It is hardy and does well in full sun. Height 18 to 24 inches. July blooming.

L. COLUMBIANUM

This is a slender, graceful Lily and a native of our Island. It is hardy and quite thrifty. The small recurved flowers are orange to yellow, more or less spotted maroon. Leaves are in whorls. Height 4 to 5 feet June-July blooming.

L. DAVURICUM

This is one of the hardiest and thriftiest of Lilies, and one of the first to bloom. It grows about two feet high and bears an umbel of three to ten orange colored flowers, flushed red with claret colored spots. Bulbs are quite small which distinguish it from *L. Umbellatum*; a form of which is frequently substituted for this desirable species.

L. HENRYI

Because of its easy culture and vigorous growth *Henryi* is becoming very popular. It closely resembles the *Speciosum* Lilies but has orange-yellow blooms which are borne on stalks from four to six feet high. July-August blooming.

L. MARTAGON ALBUM

This, one of the finest Lilies in cultivation, bears a large head of small waxy white flowers. The bulbs frequently divide before blooming. This is one of the easiest to grow and is popular. Three to four feet high. June blooming.

L. PARDALINUM

A very showy native of the Pacific Coast, bearing many recurved, bright orange flowers, heavily spotted and the petals are tipped with crimson. It grows five to six feet tall and does well in almost any good garden soil in partial shade or sun. Blooms June-July.

I also offer a special selection of Pardalinum which is larger and more vigorous. It also has a deeper red color.

L. PARRYI

I consider this the best yellow Lily. It has delicate funnel shape flowers with the tips of the petals slightly reflex. Pleasingly fragrant. Some flowers have small black dots in the throat. I have had no difficulty growing it beside Pardalinum. I offer only blooming size bulbs this year. Four to five feet high. June-July blooming.

L. PHILIPPINENSE FORMOSANUM

Long, graceful, trumpet shaped flowers of great substance mark this very desirable Lily. Three to ten flowers are borne on stems four to six feet high. The waxy white petals are some-

times flushed pink to purple outside. Anthers are golden to chocolate color. Foliage resembles the Regale. Not hardy. For a cool greenhouse or a sheltered position out doors this is one of the best. Blooms August-September.

L. REGALE

Too well known to need description this Lily is becoming more popular every year. I supply some of the most discriminating dealers with fancy stock.

L. ROEZHII

This rather rare Lily resembles *Pardalinum* but is more graceful. Flowers are fewer and the foliage is finer. I have vegetatively propagated, uniform stock. Blooms early July. Four to five feet high.

ROEZHII CRIMSON: A selected form with blood-red petals is also offered.

L. SUPERBUM

This well known native of eastern U. S. resembles *Pardalinum* in flower and foliage, but blooms about three weeks later. Plant both.

I can supply some extra fine bulbs of this variety.

L. TENUIFOLIUM

The Siberian Coral Lily or Red Russian Lily will do well under almost any condition. Its fine

grassy foliage and bright scarlet Turkscap flowers give it a distinctive appearance. Old established bulbs bear 20 to 30 flowers.

I recommend three-fourths inch bulbs but can supply a few extra large bulbs for those whose trade demands size. Eighteen to 24 inches high. Early June blooming.

L. TESTACEUM

A natural hybrid of unknown origin, this magnificent Lily has been in cultivation for almost 100 years, but is still quite scarce. It is hardy and quite thrifty when established but resents moving and many bulbs are lost in transplanting. I recommend September planting. Blooms in July. Color nankeen yellow.

L. UMBELLATUM

Bearing large umbellate heads of bright orange and red flowers this variety is especially valuable for mass planting in the hardy border and among shrubs. The stalks are sturdy and the foliage heavy. They do well in any good garden soil.

I have found a few varieties sent out by dealers under many names.

A variety found in local gardens is slightly larger and has brighter colored flowers than any other that I have seen. It blooms about ten days later than Sappho or Erectum and is a very desirable form.

I offer Erectum, Grandiflora, Sappho and Local Unnamed at the same price.

L. WASHINGTONIANUM PURPUREUM

This is perhaps the most attractive of the American Lilies, but is not easy to grow. Some of the trouble has been due to the use of collected bulbs. I have little trouble in moving seedlings. The flower stems are three to six feet high and the foliage is in whorls. Good plants often carry twenty to thirty flowers. The pink tinted buds open to white bell shaped flowers with numerous fine purple dots. As the flower ages it turns pink, then purple. Fragrant. June blooming.

HYBRIDS

The U. S. Bulb Station at Bellingham under the direction of Dr. Griffiths has produced some excellent hybrids. Five of these were disseminated in 1931. Of these I consider Shuksan especially valuable. It has the magnificent form and color of Humboldtii, combined with the easy handling qualities of Pardalinum; the other parent.

I offer two-year-old bulbs to bloom next year. Correspondence solicited from those interested.

I also have several other varieties in quantities too small to list. Ask for prices on any Lilies you need.
